

Module: Scene Management

Overview

Scene management is a critical aspect of accident response, involving systematic approaches to ensure safety and evidence preservation.

Coordinated planning is essential for establishing cordon areas and controlling access to the site. Early assessment of the scene allows responders to identify hazards and prioritize actions effectively.

Technical areas of evidence must be preserved to support investigations, requiring careful documentation and collection procedures. In cases of mass casualties, temporary mortuaries may be established for Disaster Victim Identification (DVI) efforts.

Additionally, personal property recovery by police is essential for supporting victims' families. By employing coordinated planning and recovery techniques, responders can enhance the effectiveness and safety of accident scene management.

Programme Code M_SM

Programme Outline

- Scene management
- Cordon planning
- Early assessment of the site
- Technical areas of evidence
- Temporary mortuary for Disaster Victim Identification (DVI)
- Personal property recovery (Police)
- Coordinated planning, search and recovery techniques

Programme Class Classroom face-to-face

Contact Hours 4 hours

Certificate Certificate of Completion
